Make the Best Box

We need to make a box with an open top out of a 12x18 sheet of material by removing congruent squares from each corner. Furthermore, we would like to maximize the volume.

1. Begin by making your best guess, and building a box that you think will have the greatest volume.
2. Now, write functions for the surface area and the volume of the box in terms of x .
3. Now use the derivative of the volume function to find the *exact* value of x that will maximize the volume.
4. What is the exact surface area of the final box?
5. Extra challenge... what is the exact volume of the final box?
